

# Indirect Communication

Dr. Petru Florin Mihancea

V20180301

# 1

## The Problem

Dr. Petru Florin Mihancea

### Why?

#### Space coupling

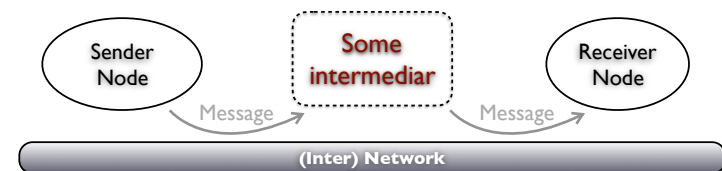

Communication is directed towards a given receiver(s)

#### Time coupling

Sender and receiver(s) exist at the same moment of time

Dr. Petru Florin Mihancea

### Why?

#### Space uncoupling

Sender does not know the receiver(s) identity

#### Time uncoupling

Sender and receiver(s) have independent lifetimes

Many approaches: Group communication, Publish-Subscribe, Message Queues, Distributed Shared Memory, etc.

Dr. Petru Florin Mihancea

# 2

## Indirect Communication Approaches

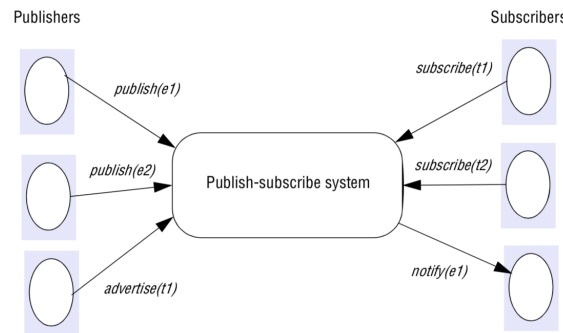

Dr. Petru Florin Mihalcea

# A

## Publish-Subscribe Systems Distributed Event-Based

Dr. Petru Florin Mihalcea

### Basic Functions

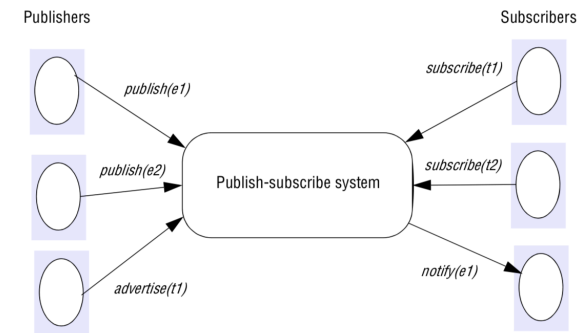

G. Coulourie et. al., Distributed Systems

### Publishers

- announce an event via **publish(e)** operation

Dr. Petru Florin Mihalcea

### Basic Functions

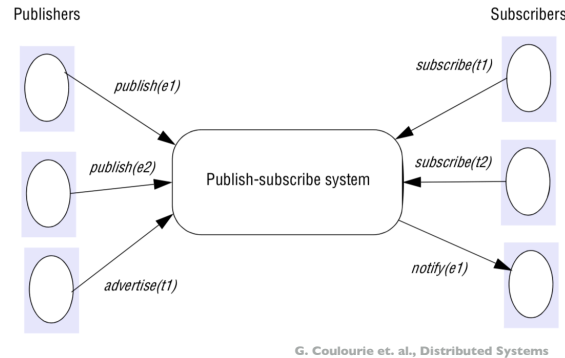

G. Coulourie et. al., Distributed Systems

### Subscribers

- express interest in some events via **subscribe(t)** operation
  - **t** is a **filter** used to specify the events of interest
- get notified via **notify(e)** when an event of interest occurs

Dr. Petru Florin Mihalcea

## Basic Functions

### Extra elements

- **unsubscribe(t)** revoking subscriber interest in an event
- **advertise(t)** enables a publisher to declare the kinds of events it produces

Dr. Petru Florin Mihalcea

## Specifying Events of Interest

### Channel-based

Subscribe to a **named channel** and get all events sent to it

### Topic-based

Subscribe to a **topic** and an event **explicitly specifies** its topic

### Content-based

Subscribe with a **query** specifying combined event attributes

### Type-based

Filter based on the **types** of the event **objects**

Other: Observe object state change, context (e.g. location), complex event patterns in time

Dr. Petru Florin Mihalcea

## Publish-Subscribe Implementations

### Architectures

#### Centralized

A node acting as the central event broker

#### Network of brokers

Several nodes cooperate just to manage the events

#### Peer-to-peer

No distinction between publisher, subscriber and broker

### Event **routing** in **distributed** implementations

Flooding, Filtering, Rendezvous

### Examples

**OpenJMS** [<http://openjms.sourceforge.net/>]

Included in application servers

**GlassFish** [<https://javaee.github.io/glassfish/>]

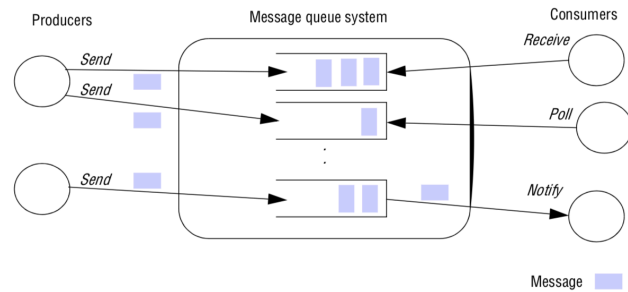

Dr. Petru Florin Mihalcea

# B

## Message Queues

Dr. Petru Florin Mihalcea

## Basic Functions

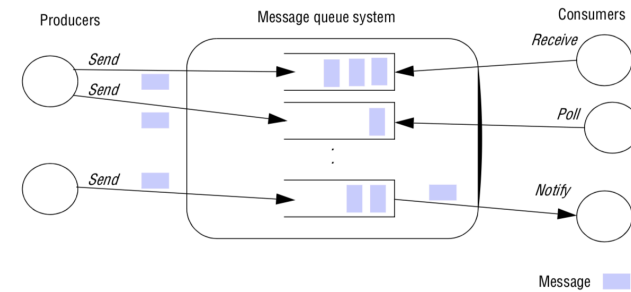

G. Coulourie et. al., Distributed Systems

### Producers

- add messages to a specific **queue** via the **send** operation

Dr. Petru Florin Mihalcea

## Basic Functions

G. Coulourie et. al., Distributed Systems

### Consumers

- consumes messages from a **queue** via
  - blocking **receive** operation
  - non-blocking **poll** operation
  - **notification** operation

Dr. Petru Florin Mihalcea

## Additional Features

### Queue policy

Simple FIFO, Priority queues, Properties-based selection

### Message persistency

#### Reliable delivery

Messages will be delivered once but we do not know when

### Other

**Transactions and transformations**

Dr. Petru Florin Mihalcea

## Message Queues Implementations

### Architectures

#### Centralized

A node acting as the central message queue manager

#### Distributed

Cooperating message queue managers

### Examples

OpenJMS, WebSphereMQ

Included in application servers

**GlassFish** [<https://javaee.github.io/glassfish/>]

Dr. Petru Florin Mihalcea

# 3

## Java Message Service (JMS) Middleware

Dr. Petru Florin Mihalcea

## JMS API

**Allows applications to create, send and receive messages to/from:**

**queues** (message queues systems)

**topics** (publish-subscribe systems)

### JMS Provider

**an implementation of this API like  
OpenJMS, GlassFish, etc.**

Dr. Petru Florin Mihalcea

## Prepare Glassfish JMS Provider

### 1. Download it and unpack

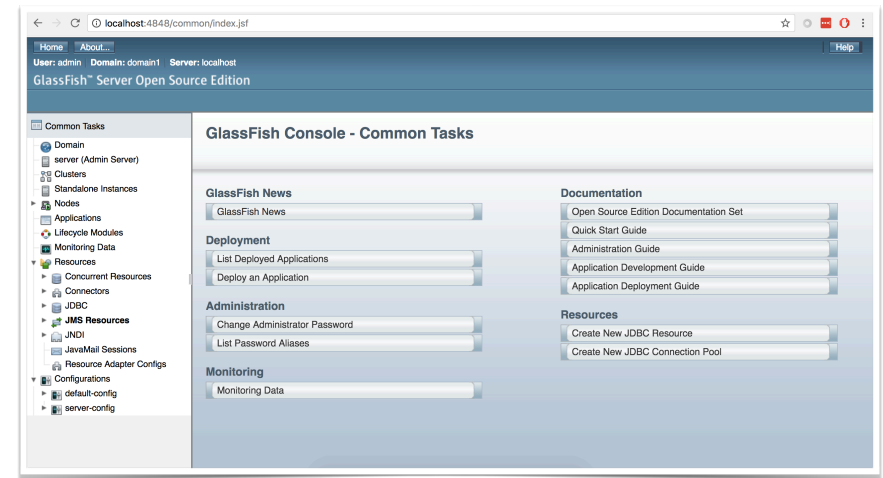

<https://javaee.github.io/glassfish/download>  
or the prepared packet from the lab page :)

### 2. In a terminal, go to the **bin** folder and run [sh] asadmin start-domain —verbose

### 3. In a browser, go to <http://localhost:4848/>

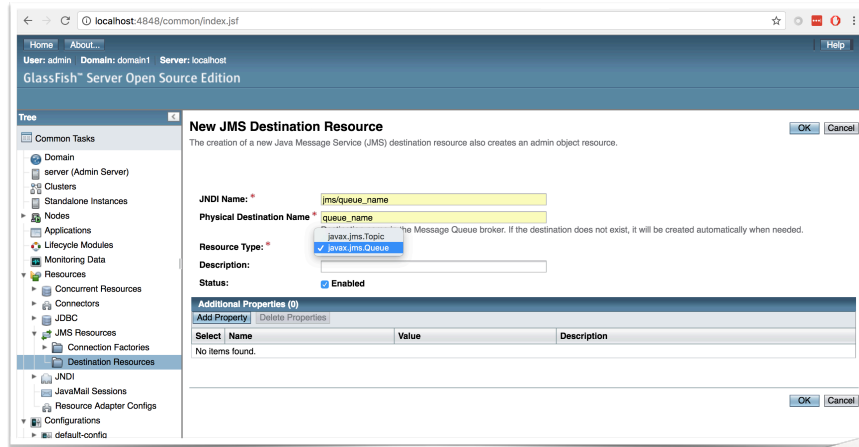

Dr. Petru Florin Mihalcea

## Prepare Glassfish JMS Provider

Dr. Petru Florin Mihalcea

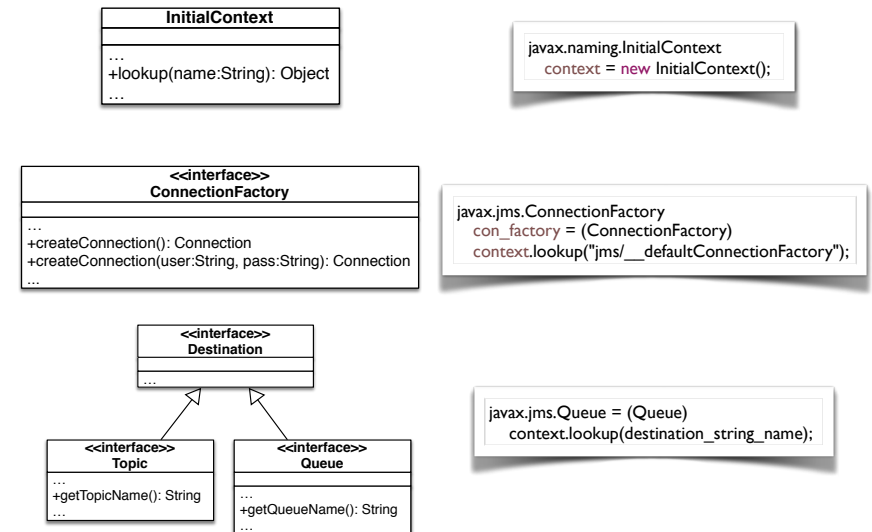

## Create a Destination

Thus, a destination is a **queue** or a **topic**

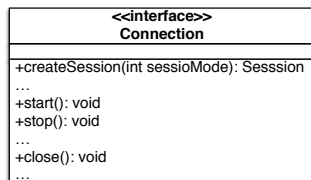

Dr. Petru Florin Mihances

## Locating Relevant Objects

Dr. Petru Florin Mihances

## Connection and Session

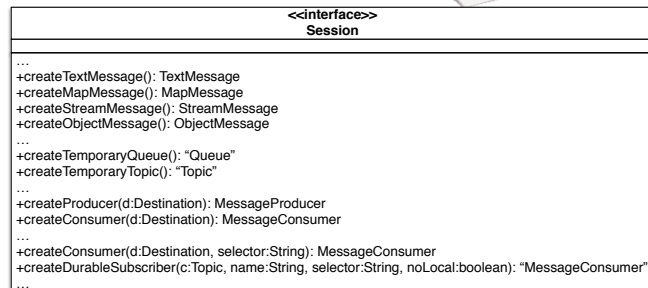

```

javax.jms.Connection con = con_factory.createConnection();
javax.jms.Session ses =
    con.createSession(JMSSContext.AUTO_ACKNOWLEDGE);
...
con.start();
...
con.close();

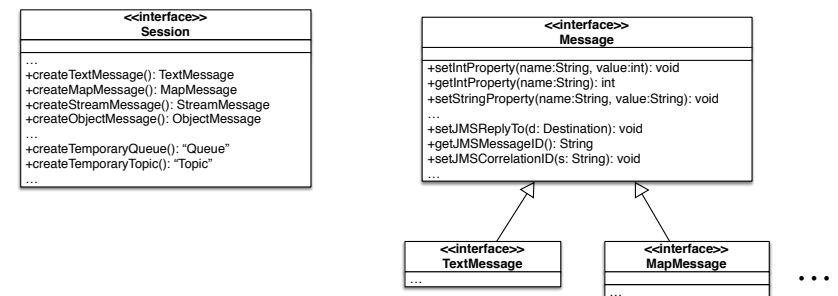

```

Other **JMSContext** constants may be used to require transacted sessions, explicit client ACK, etc.

Dr. Petru Florin Mihances

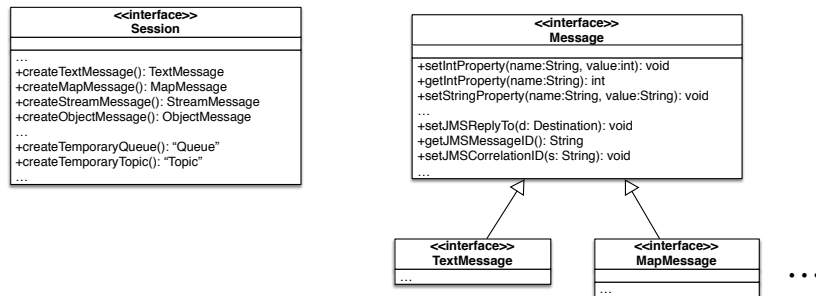

## Messages

**Message properties**  
key-value pairs enabling message filtering

Dr. Petru Florin Mihances

## Messages

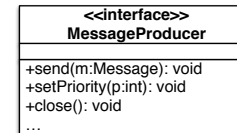

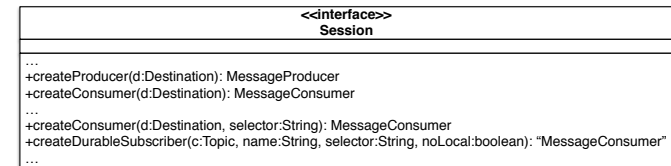

### Temporary destinations

a way of getting back an answer

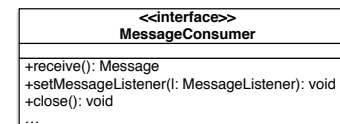

**messageID** and **correlationID** are usually used to pair the request/reply messages

Dr. Petru Florin Mihances

## Consumers and Producers

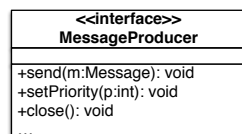

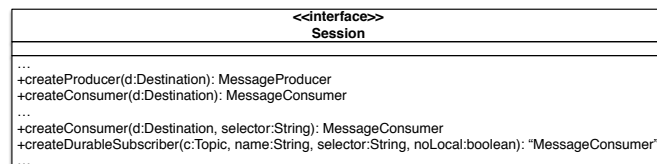

Sends messages to the **associated destination**  
**priorities** can be included

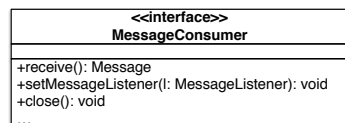

Gets messages from the **associated destination**  
**synchronously** (blocking receive)  
**asynchronously** (the listener is called by the JMS infrastructure when a message is available)

Dr. Petru Florin Mihances

## Consumers and Producers

Sends messages to the **associated destination**  
**priorities** can be included

Gets messages from the **associated destination**  
**synchronously** (blocking receive)  
**asynchronously** (the listener is called by the JMS infrastructure when a message is available)

**selectors** - SQL92 string over properties for message filtering  
**durable** - the named consumer will get the messages when it is back "online"

Dr. Petru Florin Mihances

# 4

## Demo Application

Same application but the server waits for requests set in a **message queue** and answers to the client via a **temporary queue**

Dr. Petru Florin Mihances
